 - Standards
 - Broadcasting
 - 8/16-VSB
- Some comparisons
 - Tests in Australia

ATSC

- Advanced Television Systems Committee
- Started May 1983
- Explore the need for and coordinate national technical standards for Advanced Television
- Generation, distribution and reception of enhanced TV and HDTV
- Members: ABC, CBS, Televisia (Mexico), Sun, TI, Zenith, Dolby Lab, Eastman Kodak, Sony MIT
- ATSC Standards
- ATSC Recommended practice

ATSC

- CBS: 1080 i (1080 lines interlaced)
- ABC, NBC, FOX: 720P
- Schedule
 - Analog stops after 2006

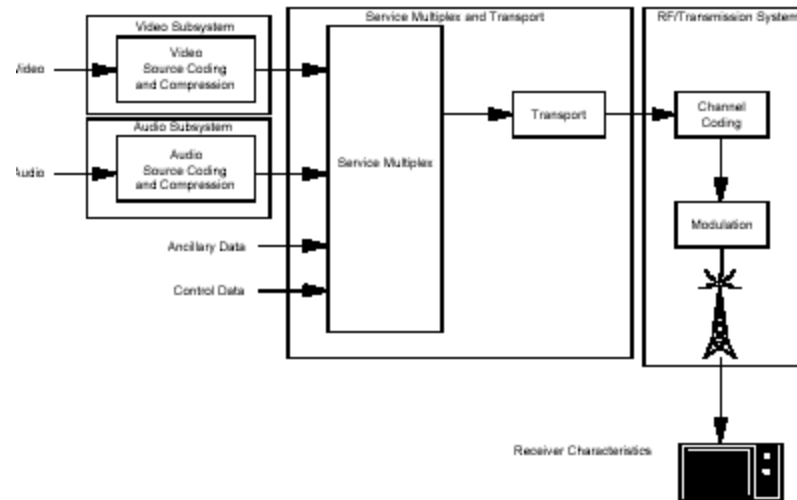

ATSC

Some standards by ATSC

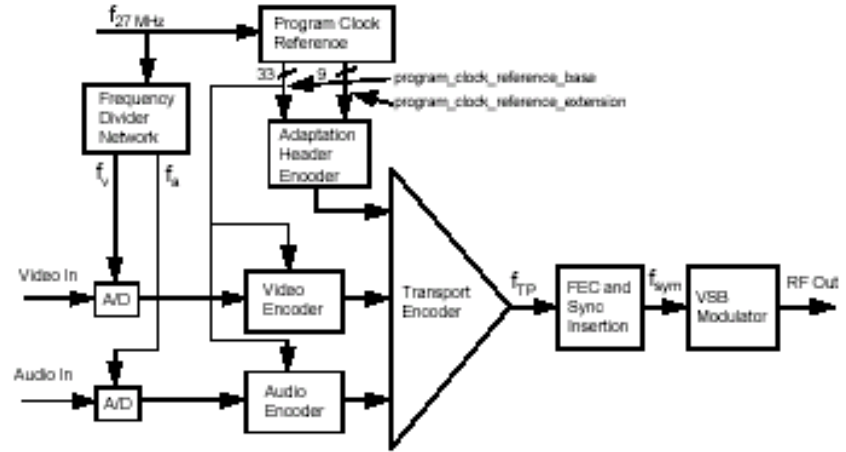

- A/53B Digital Television Standard (DTV)
- A/52A Digital Audio Compression AC-3
- A/65A Program and System Information Protocol
- A/70 Conditional Access System
- A/80 Modulation and Coding for DTV over Satellite
- A/90 Data Broadcast Standard

Digital Television Standard

- High quality video over a 6 MHz channel
- 19 Mbit/s terrestrial broadcasting
- 38 Mbit/s cable broadcasting
- Video: MPEG-2, Audio: AC-3

DTV – Multiplex

- ISO/IEC 13818-1 – Fixed-length packet transport
- Multiplexes are identified using PID
- PES – Packetized Elementary Stream – Encapsulated Video and Audio stream

DTV – RF/Transmission system

Encoded transport packet size:

187 data bytes + 20 RS parity bytes = 207 bytes

207 bytes · 8 bits/byte = 1656 bits

2/3 rate trellis coding requires $\frac{3}{2} \cdot 1656$ bits = 2484 bits

DTV – RF/Transmission system

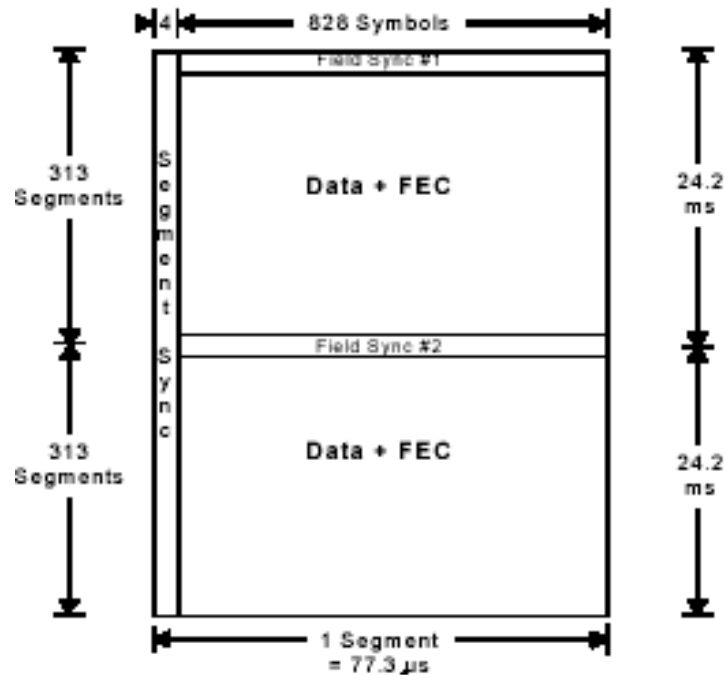

Data organization for transmission:

Frame: 2 data fields

Data field: 313 segments

Segments: 828 symbols

(828 x 8 bits = 2484 bits)

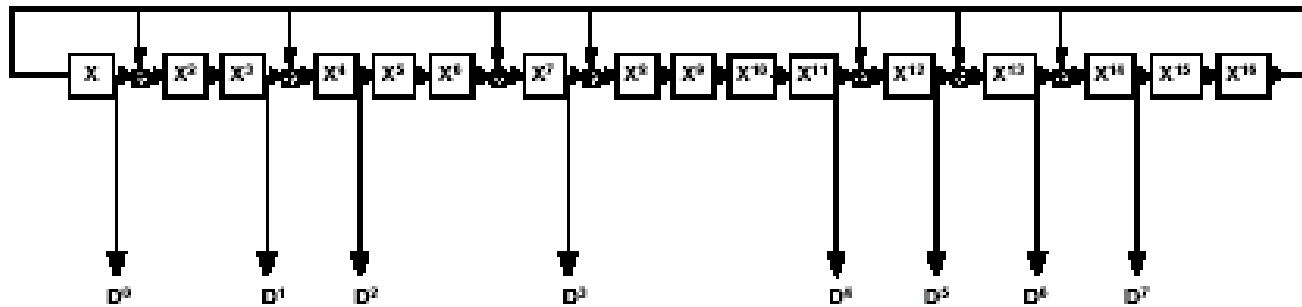

DTV – Data Randomizer

Generator Polynomial $G_{(16)} = X^{16} + X^{13} + X^{12} + X^{11} + X^7 + X^6 + X^3 + X + 1$

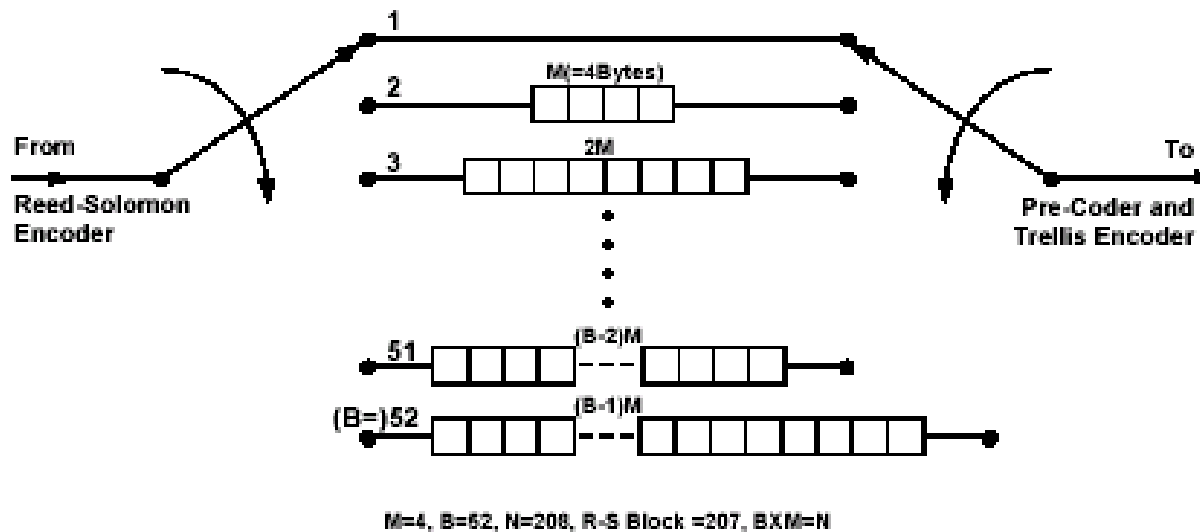

The initialization (pre load) occurs during the field sync interval

Initialization to F180 hex (Load to 1)
 $X^{16} X^{15} X^{14} X^{13} X^9 X^8$

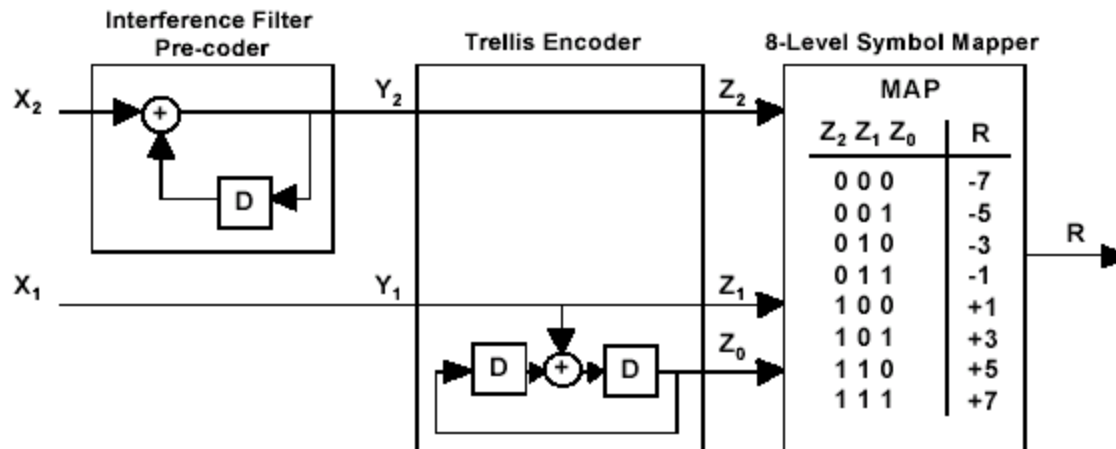

DTV – Reed Solomon, interleaving

- Reed solomon encoder RS(207,187) -> 10 bit parity (compare DVB-T RS(204,188))
- Byte interleaver:

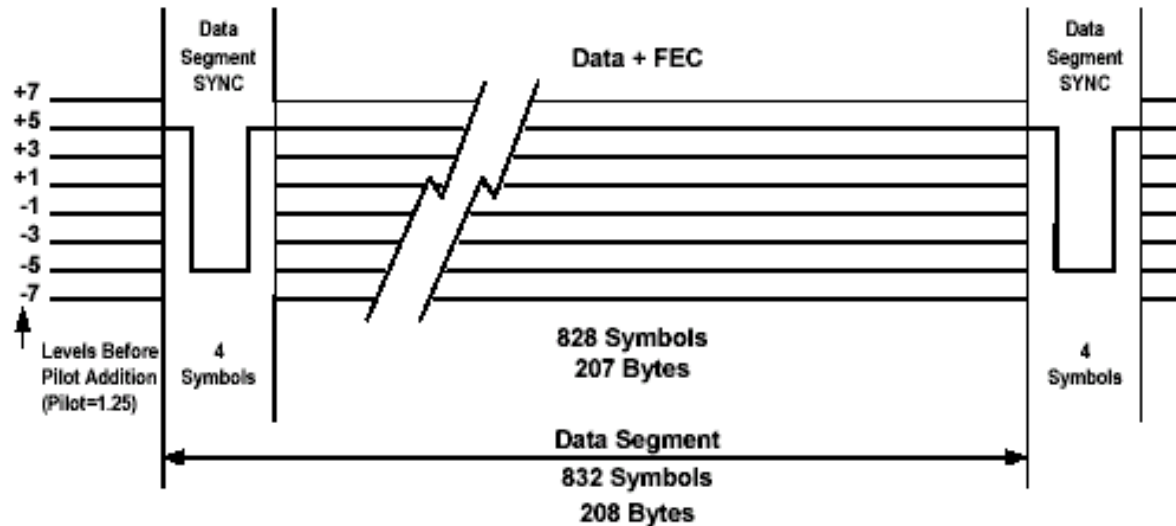

DTV – Trellis encoding

2/3 rate trellis code, mapped into 8 levels

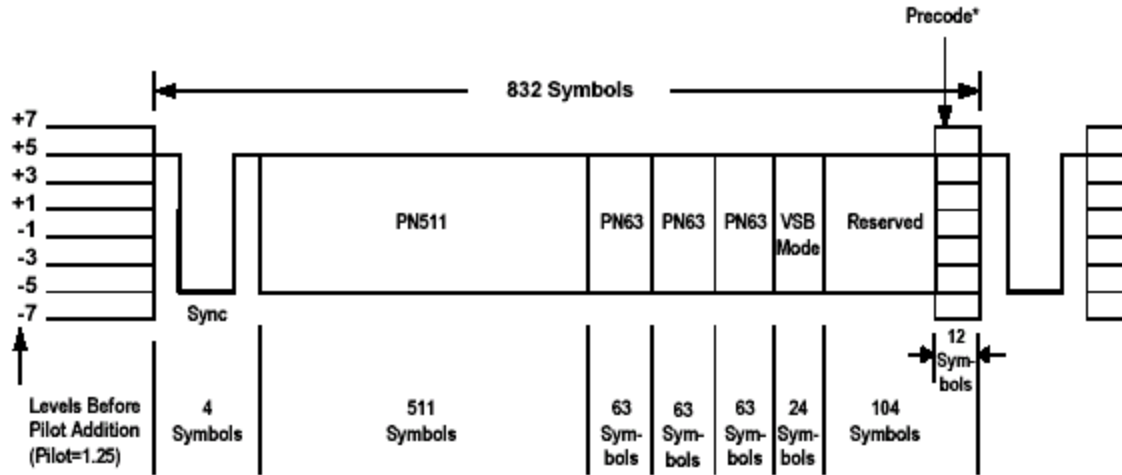

$D = 12$ symbols delay

DTV – VSB Data segments

Sync: 4 sybols of 2 levels = {1 0 0 1}

DTV – Data Field sync

* For trellis coded terrestrial 8 VSB the last 12 symbols of the previous segment are duplicated in the last 12 reserved symbols of the field sync.

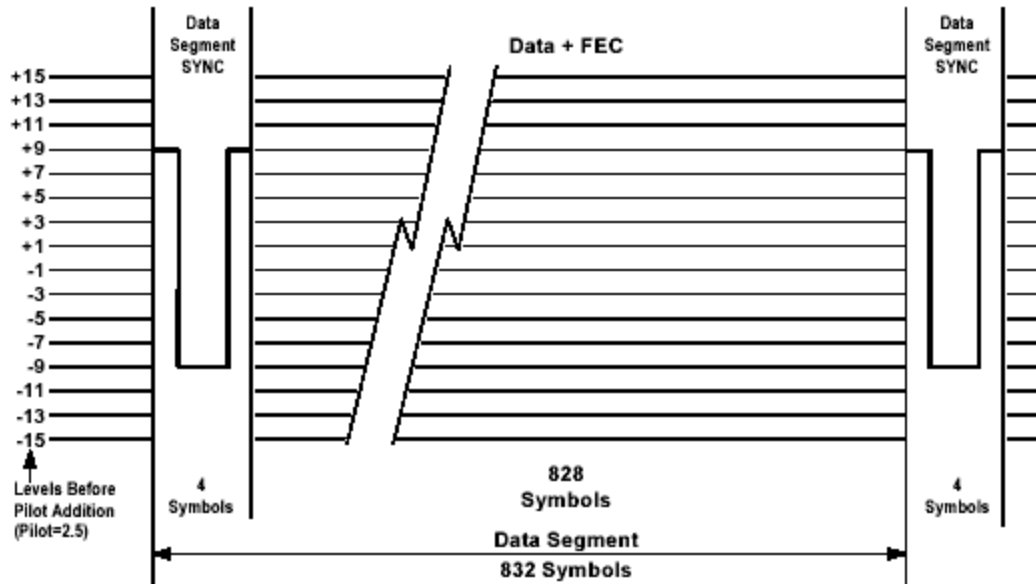

4 symbol sync = { 1 0 0 1 }

PN511: Pseudo random signal

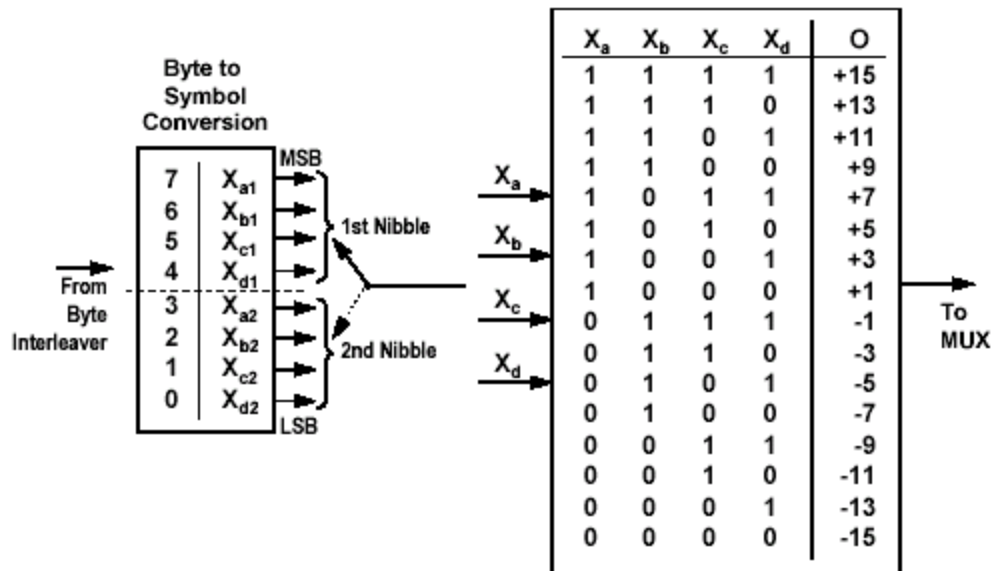

PN63: Pseudo random signal

VSB mode: 8-VSB or 16-VSB

DTV – 16 VSB

DTV – 16 VSB

DTV – VSB Modulation

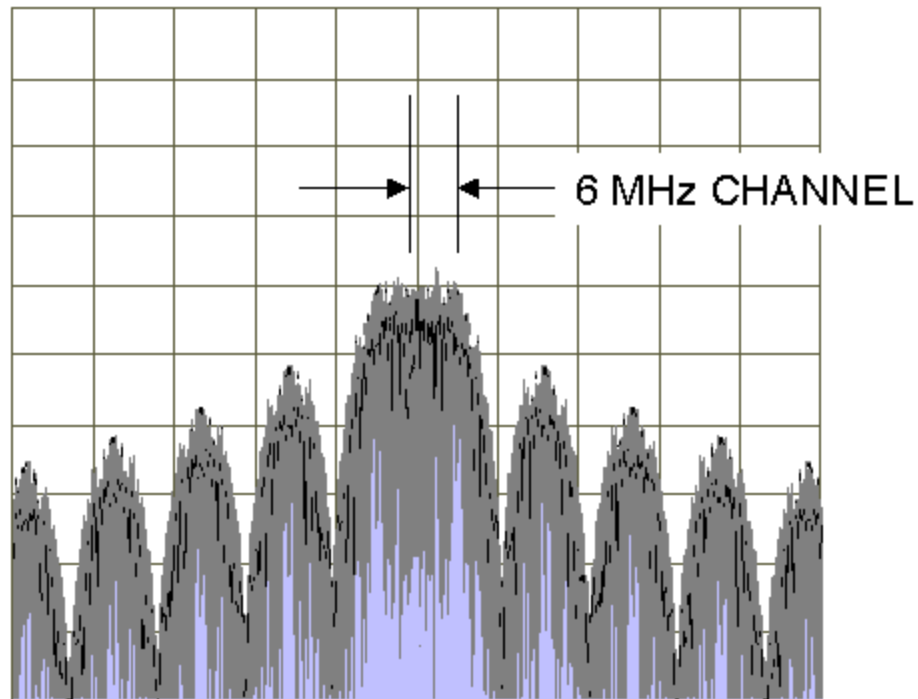

- 8-VSB – Amplitude modulation with 8 amplitude levels

DTV – VSB Modulation

Amplitude-modulating using the signal gives the following spectrum:

How fit into
6 MHz ?

DTV – VSB Modulation

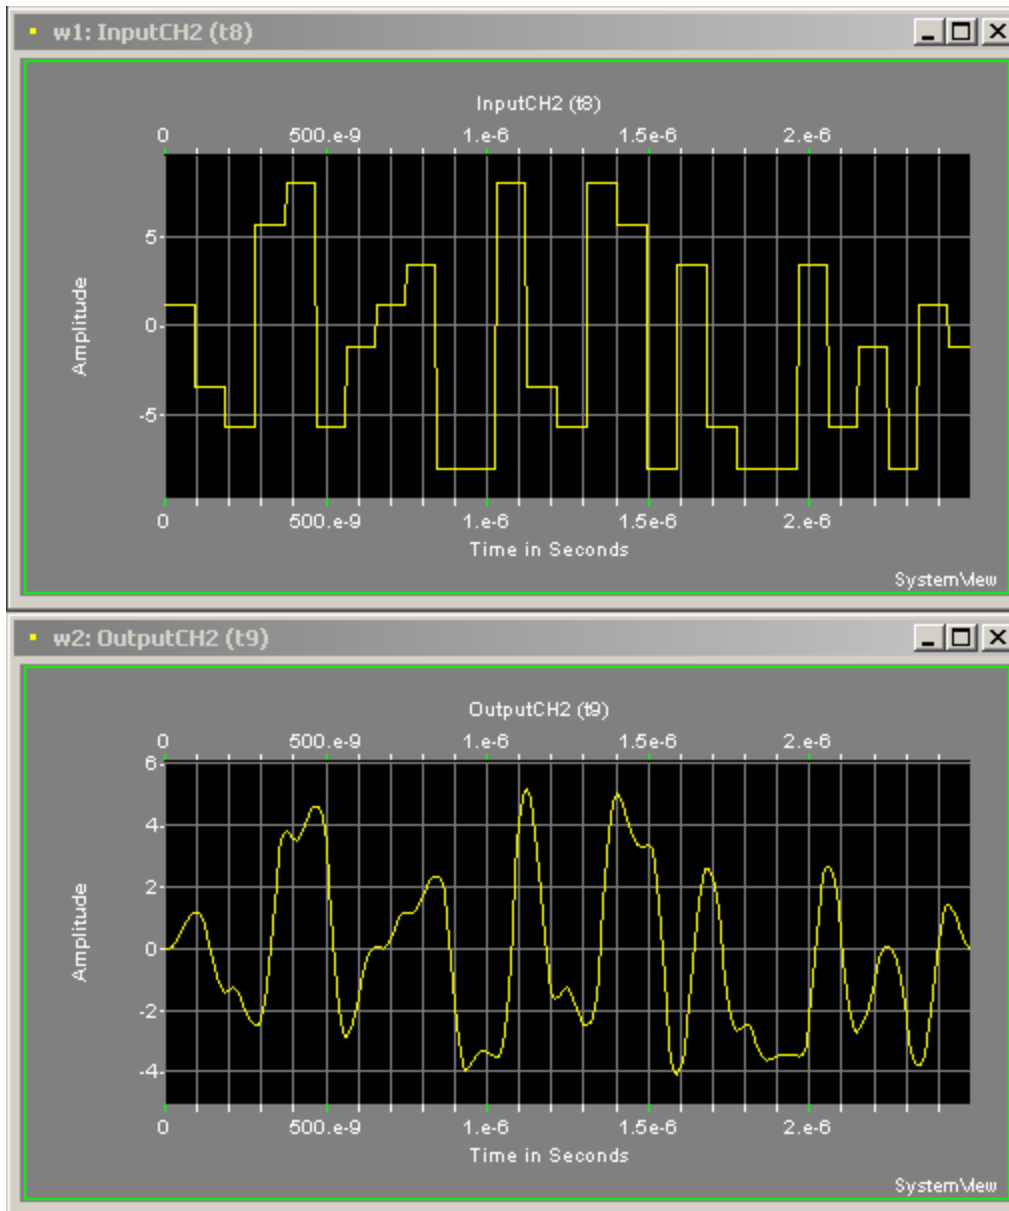

Symbol rate 10,76 MHz

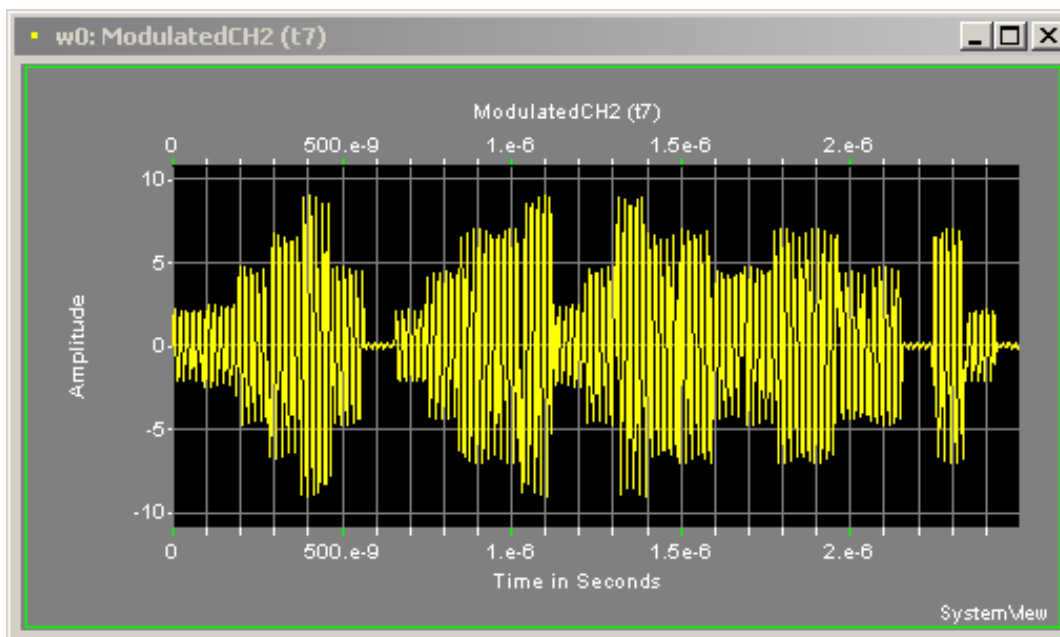

Using Nyquist theorem, sampling rate must be twice the bandwidth (compare Audio CD)

Gives bandwidth of 5,38 MHz

This bandwidth is generated using filtering
